Cognitive Telescope Network

Arunava (Ron) Majumdar Shane Larson, PhD

Multi-messenger Astronomy Telescopic follow-up of transient events

IBM Cloud University 2017

Please note

IBM's statements regarding its plans, directions, and intent are subject to change or withdrawal without notice at IBM's sole discretion.

Information regarding potential future products is intended to outline our general product direction and it should not be relied on in making a purchasing decision.

The information mentioned regarding potential future products is not a commitment, promise, or legal obligation to deliver any material, code or functionality. Information about potential future products may not be incorporated into any contract.

The development, release, and timing of any future features or functionality described for our products remains at our sole discretion. Performance is based on measurements and projections using standard IBM benchmarks in a controlled environment. The actual throughput or performance that any user will experience will vary depending upon many factors, including considerations such as the amount of multiprogramming in the user's job stream, the I/O configuration, the storage configuration, and the workload processed. Therefore, no assurance can be given that an individual user will achieve results similar to those stated here.

Arunava (Ron) Majumdar arunava@us.ibm.com

Asset Portfolio Strategy Leader, Chicago Center for Advanced Studies Leader Architect, Emerging Technology Practice, IBM Cloud and Cognitive

@arunavaibm

Shane L. Larson is a research associate professor of physics at Northwestern University, and an astronomer at the Adler Planetarium in Chicago. He works in the field of gravitational wave astrophysics, specializing in studies of compact stars, binaries, and the galaxy. He works in gravitational wave astronomy with both the ground-based LIGO project, and the future space-based detector LISA.

Shane grew up in eastern Oregon, and was an undergraduate at Oregon State University where he received his B.S. in Physics in 1991. He received a Ph.D. in theoretical physics (1999) from Montana State University. He is an award winning teacher, and a Fellow of the American Physical Society. He currently lives in the Chicago area with his wife, daughter and cats. He contributes regularly to a public science blog at writescience.wordpress.com, and tweets with the handle @sciencejedi.

Shane L. Larson, Ph.D. s.larson@northwestern.edu

Part II: Architecting a solution

"Only those who will risk going too far can possibly find out how far one can go." - T.S. Eliot

Cognitive Telescope Network From a 100-year old Concept to Ideation

1915: Einstein publishes his paper on **General Relativity**, a geometric theory of gravitation. It generalizes **Special Relativity and Newton's Law** of universal gravitation, describing gravity as the curvature of spacetime in his *field equations*: $R_{\mu\nu} - \frac{1}{2}R g_{\mu\nu} + \Lambda g_{\mu\nu} = \frac{8\pi G}{c^4} T_{\mu\nu}$

where $R_{\mu\nu}$ is the Ricci curvature tensor, R is the scalar curvature, $g_{\mu\nu}$ is the metric tensor, Λ is the cosmological constant, G is Newton's gravitational constant, c is the speed of light in vacuum, and $T_{\mu\nu}$ is the stress-energy tensor

1918: Einstein published the paper Über Gravitationswellen, effect of gravitational waves was calculated resulting in the *quadrupole formula* describes rate at which gravitational waves are emitted from a system of masses based on the change of the (mass) quadrupole moment. The formula reads

$$ar{h}_{ij}(t,r)=rac{2G}{c^4r}\ddot{I}_{ij}(t-r/c),$$

where

 \bar{h}_{ii}

is the (spatial part of) the trace reversed perturbation of the metric (i.e. the gravitational wave) and $~I_{ii}$

is the mass quadrupole moment

1936: Einstein, Rosen came to the conclusion, that gravitational waves do not exist!

1938: Einstein, Infeld and Hoffmann (EIH) equations show that there is no radiation up to the order (v/c)⁴, the energy remains constant.

1947: Ning Hu demonstrates that quadrupole formula occurs at (v/c)5.

1975: Hulse and Taylor discovers the binary pulsar PSR1913 + 16. Their data showed a decrease of the period of revolution – as predicted by the quadrupole formula.

2016: Laser Interferometer Gravitational-Wave Observatory (LIGO) team announces they had detected Gravitational Waves for the first time. The event occurred at September 14, 2015 at 5:51 a.m. Eastern Daylight Time (9:51 a.m. UTC) by both detectors, located in *Livingston, Louisiana, and Hanford, Washington, USA*.

Photons as Messenger

Ever since the dawn of time human beings are trying to decipher the mysteries of the Universe by looking at the Sky.

~200 BC – Hipparchus creates a magnitude system (1-6) and catalogs 850 stars

1610 – Galileo Galilei publishes Sidereus Nuncius from his observations from the telescope

1668 – Isaac Newton builds reflecting telescope

1990 – Hubble Space Telescope is launched by NASA

2009 – Largest Telescope on Earth commissioned Gran Telescopio Canarias, Canary Islands, Spain beating Keck 1 and Keck 2, Mauna Kea Observatory, Hawaii

2012 – Construction of Giant Magellan Telescope will be located at Cerro Las Campanas at Las Campanas Observatory in the Atacama Desert of Chile

2018 – James Webb Space Telescope expected to be launched

Since the prediction by Einstein scientists have been trying to detect Gravitational Waves.

- Detect not with light, but with gravity.
- Gravitational waves are complementary to photons
 - Photons are made by atoms
 - Gravitational waves made by the dynamic motion of matter
- Laser Interferometers, not telescopes are required for the detection
- LIGO US-based detectors at Livingston, Louisiana, and Hanford, Washington
- VIRGO Italy-France-based initiative at Santo Stefano a Macerata, Cascina , Italy
- LISA 1st Space-based Interferometer using 3 satellites, European collaboration

Gravitational Wave Detectors

(1995) TAMA 300 - Japan - Decommissioned

(1995) GEO 600 - Sarstedt, Ruthe, Germany: http://www.geo600.org/

(2002) LIGO - Livingston, Louisiana and Hanford, Washington, USA: http://www.ligo.org/

(2003) MiniGrail - Leiden University, Netherlands: http://www.minigrail.nl/

(2005) Pulsar Timing Array (using radio-telescope): https://en.wikipedia.org/wiki/Pulsar_timing_array

- Parkes PTA, European PTA, North American Nanohertz Observatory for Gravitational Waves (NANOGrav) (2006) CLIO - prototype for KAGRA

(2007) Virgo - Santo Stefano a Macerata, Cascina , Italy: https://www.ego-gw.it/

(2015) LISA Pathfinder, a development mission for LISA, launched in Dec. - switched off 18 July, 2017

(2018) KAGRA - Gifu Prefecture, Japan: http://gwcenter.icrr.u-tokyo.ac.jp/en/

(2023) IndIGO - (Hingoli, Maharashtra?), India: http://www.gw-indigo.org/tiki-index.php

(2025) TianQin - Sun Yat-sen University, Zhuhai campus, China [Space-based]

(2027) DECIGO - Japan [Space-based]

(2034) LISA - Denmark, France, Germany, Italy, The Netherlands, Spain, Switzerland and the UK

- supported US, [Space-based]: https://www.lisamission.org/

(2030s) Einstein Telescope - European Union: http://www.et-gw.eu/

LIGO - Livingston, Louisiana, USA.

GW150914

29 solar mass black hole + 36 solar mass black hole 1.3 billion lightyears away (400 Mega parsec)

IBM Cloud University 2017 | October

C. Messenger (Glasgow) & LIGO

Principles of Interferometer

Gravitational Wave Detector Ranges

LISA: 5 million km arms

Set of three orbits in a near-equilateral triangular formation for thermal stability

Lyra constellation and comparing areas in the sky

Challenges

- GW detectors are poor at pointing,
 ~ 1 to 10 sq. degrees
- Standard telescopes cover small areas, ~ ½ sq. degree
- LIGO STRATEGY: Statistically point, look for galaxies in the oval
 - Cannot work when there are 1000's of galaxies in the region
- LISA STRATEGY: All sky surveys, cooperate wide field scopes (e.g. Large Synoptic Survey Telescope (LSST))

- Not a strong taxonomy of transient sky phenomena for rejection

- Hard to determine what's a gravitational wave and what's changing magnitude for something else

Science behind the Network

Solution

- **STRATEGY**: Cover the error ellipse with small aperture wide-field telescopes
- ADVANTAGES: Lots of glass on the sky, worldwide coverage, on demand

- Universities, Institutes and amateurs have sub-meter telescopes as the prices of hardware has dropped over the last decade

- Amateur astronomical groups can participate in meaningful research even with smaller telescopes

• **DISADVANTAGES:** Deep magnitudes take longer exposure times

- Do not have a proper taxonomy yet

IBM Cloud University 2017 | October

Lyra constellation tiling the oval

Multi-messenger Astronomy

Design Thinking

Use Cases

Use Cases

Use Cases

Use Case 05: Building the Ecosystem

Gravitational Waves Detected 100 Years After Einstein's Prediction –

LIGO Opens New Window on the Universe with Observation of Gravitational Waves from Colliding Black Holes.

https://www.ligo.caltech.edu/news/ligo20160211

LIGO can listen to gravitational waves but cannot see the event.

- Provide identification and analysis of astronomical data from multiple sources
- Event notifications to mobile devices for building interest in the Community
- Remote control instructions to telescopes point to the specific location on the grid in the sky
- Visual Recognition integration with Zooniverse for gamification of un identified events
- LIGO data feed is parsed into canonical models and passed to the Event Analyzer
- If a Gravitational Wave event is detected, the available telescopes in the network are mapped into a grid to scan the sky
- Weather and Geospatial information is used to determine optimal coverage of the viewing area

Using multi-messenger astronomy – eyes and ears on the Cosmos

LIGO Update on the Search for Gravitational Waves

Defining Hills

- Organize components under 3 Hills and Foundation
 - Hills are mapped to Epics
 - Sub-hills are mapped to Stories
- Cognitive
 - Components associated with Watson or Analytics services
- Internet-of-Things
 - Telescopes, sensors, mobile devices, etc. communicate over MQTT using IoT Foundation
- Omni-channel
 - User Interfaces for Web, Mobile, Telescope App and Eclipse
- Foundation
 - Database, design, API, etc.

Cognitive Telescope Network IBM Bluemix and Watson Services brings the idea to life

Reference Architecture

API Architecture

 Based on the Reference Architecture for Blue Compute

https://github.com/ibm-cloud-architecture/refarch-cloudnative

- Omni-channel
 - User Interfaces for Web, Mobile, Telescope App and Eclipse
- Bluemix
 - Node.js implementation for Backend-for-Frontend (BFF) pattern for the web interface.
 - Mobile, Eclipse, Telescope App, Web BFF communicates with API Gateway
 - Authentication service provided by OAuth 2.0 provided by API Connect
 - API implementations using containerized Springboot app
 - Transformation and Error handling provided by containerized MQ and IBM Integration Bus (IIB)
 - Compose based MySQL service for OLTP and Redis for Session caching
- Yellow Zone
 - Data synchronization with backend Enterprise Database using IIB flows mapping data

Reference Architecture

Reference Architecture

Pub/Sub Architecture

 Based on the Reference Architecture for IoT Reference Architecture

https://www.ibm.com/devops/method/content/architecture/iot Architecture/0_1

- Omni-channel
 - User Interfaces for Web, Mobile and Eclipse
- Proximity Network
 - IoT Gateway hosted on Bluemix
 - App subscribes to specific events and publications
- Public Network
 - Telescopes can register from other networks using the API for the Telescope Commander
 - Social Media feeds are consumed
 - Information is published to users and administrators
- Bluemix
 - API Implementations using containerized Springboot app
 - Watson Discovery searches documents for events
- Yellow Zone
 - Data synchronization with backend Enterprise Database
 using IIB flows mapping data

Future Architecture Alignments

Future Reference Architecture

API Connect

API Connect Communication

API Definitions

- The User Authentication API provides the login and authorization and creates a persistent session
- All other APIs are dependent on the login to be successful and validated
- Component specific APIs
- Product Definition
 - APIs are packaged in the CTN-product
 - Several Plans are added to the product for rate limits and conditions and prices for the plan
- Catalog
 - Products are deployed to a catalog in an API manager organization
- Gateway
 - Datapower Gateway hosts the API definition and a Security enforcement point
- Developer Portal
 - Provides and interface to track and subscribe to published APIs
 - Analytics to determine the usage
